LATERAL JACK
FOR SECONDARY HUMERAL HEAD DISTRACTION
IN THE LATERAL DECUBITUS POSITION
The Lateral JACK is designed for use with the SPIDER Limb Positioner for shoulder surgery in the Lateral Decubitus position when additional distraction is required. The Lateral JACK lifts the head of the humerus to create more working space in the shoulder joint during instability repairs.

- Low Profile - Does not interfere with portal placement
- Rotation - JACK can be swung in and out of the surgical field based on the surgeon’s need for distraction
- Hydraulic lift - Allows for easy distraction, and greater surgeon control
