Extending the capabilities of the device you trust the most
One of the strongest fixation devices for cruciate reconstruction just got better. The Smith & Nephew XTENDOBUTTON® Fixation Device, used in conjunction with any Smith & Nephew ENDOBUTTON device, allows a 6 to 10 mm area of the femoral tunnel to be covered. In addition to providing an effective solution for cortical blowouts, this feature offers a variety of benefits to surgeons:

Reduced surgical time – reconstruction procedures using the XTENDOBUTTON device only require one primary drill that can be used for the entire distance of the femoral tunnel.

More options for revision procedures – allows surgeons to adapt to a variety of possible intraoperative complications seen in revision cases.

Low profile fixation for pediatric cases – outside-in drilling to avoid growth plates is now possible, eliminating the need for a washer and resulting in a lower profile fixation.
